P-PSDB; AAB15081. 

Isolated NAC1 gene sequence from Arabidopsis thaliana is used to produce transgenic plants which are larger than the wild type versions

Claim 1; Page 18-20; 35pp; English.

The present sequence is the Arabidopsis thaliana NACl gene. This gene belongs to the NAC family of genes which may play a role in patterning of the shoot and floral meristem. This gene was isolated from an A. thaliana cDNA library expressed in Schizosaccharomyces pombe cells. The present gene may be used for making a genetically altered plant which is larger than a wild type version of the plant by overexpressing NACl. The modified plant produces larger leaves, larger roots and more lateral roots than the wild type version.

The present sequence is Arabidopsis thaliana transcription factor cDNA. The transcription factors are used to alter the structure and developmental characteristics of plants such as soybean, wheat, corn, potato, cotton, rice, olised rape, sunflower, alfalfa, sugarcane, turf, banana, blackberry, blueberry, strawberry, raspberry, carrot, cantaloupe, cauliflower, coffee, cucumber, egyphart, grappes, mango, lettuce, honeydaw, melon, onlon, papaya, peas, peppers, pineapple, spinach, squash, sweet corn, tobacco, tomato, watermelon, rosaceous fruits and vegetable brassicas. The transcription factors are specifically useful for modifying traits associated with plant's pathogen tolerance such as alterations in cell wall composition, trichome number or structure, callose induction, phytoalexin conduction, and alterations in the cell death response. Transgenic plants expressing these transcription factors are more tolerant to biotrophic or necrotrophic pathogens such as fundi, bacteria, mollicutes, viruses, nematodes and paramitic higher plants. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids encoding plant transcription factor polypeptides, useful for altering the pathogen resistance characteristics of plants, e.g. corn, potato and cotton plants

plants environmental stress. The transcription factor is encoded by environmental stress tolerance gene derived from Arabidopsis thaliana. The transcription factors and the genes encoding them are used to alter soybean, wheat, corn, potato, cotton, rice, oilseed rape, sunflower, alfalfa, sugarcane, tuff, banana, blackberry, blubberry, strawberry, raspberry, cantaloupe, carrot, cauliflower, coffee, onlon, cucumber, peppers, pincapple, spinach, squash, sweet corn, tobacco, tomato, watermelon, rosaceous fruits and/or vegetable brassicas. These sequences are also used for modifying traits associated with environmental stress tolerance, such as freezing, chilling, heat, drought, water saturation, are used in gene therapy.
                                                                                                                                                                                                                                                                     gaagaagagatgaaggaaagtagtataagcatggtggaggcaaagttgcctccgggattc 157

transcription factor homologue. This novel transcription factor transcription factor homologue. This novel transcription factor decided to a setul for modifying a plant's phenotype in desirable ways, such as encoded by environmental stress. The transcription factor is encoded by environmental stress. The transcription factor is encoded by environmental stress tolerance gene derived from Arabidopsis thaliana. The transcription factors and the genes encoding them are used to alter the structure and developmental characteristics of plants such as soybean, wheat, corn, potato, cotton, rice, oilseed rape, sunflower, alfalfa, sugarcane, turf, banana, blackberry, papaya, strawberry, raspberry, cantaloupe, carrot, calliflower, coffee, onlon, cucumber, eggplant, grapes, honey dew, lettuce, mango, melon, blueberry, peas, peppers, pineapple, spinach, squash, sweet corn, tobacco, tomato, watermelon, rosaceous fruits and/or vegetable brassicas. These sequences care also used for modifying traits associated with environmental stress tolerance, such as freezing, chilling, heat, drought, water saturation, calt, photoconditions, radiation and ozone. The transcription factors
                                                                                                                                                                                                                                                             Nucleic acids encoding plant transcription factor polypeptides, useful for altering the environmental stress tolerance characteristics of

OLDER MICE CARRYING AN HR WUTATION HAVE BEEN REPORTED TO POSSESS ALFERED RATIOS OF T-CELL-DEPENDENT B-CELL RESPONSES. MICE HOMOZYGOUS FOR HR MUTATION ARE UNIQUELY SENSITIVE TO UV AND CHEMICALLY INDUCED
